Adobe Photoshop is the most widely used photo and graphic-editing package. Adobe Photoshop is an industry standard for digital imaging. Professionals and hobbyists use it to create a variety of images, including pictures, movies, logos, calendars, brochures, and other types of media. Photoshop has been around longer than most other applications and is marketed to professionals. It's mainly been a photography program for most of its existence, but it also has expanded to include other digital imaging functions including photo manipulations. Photoshop is popular among professional photographers because it includes many popular features used to produce high-quality photographs, including much of the same tools found in camera products and photo editing software. Basic Photoshop Features Although Photoshop is primarily an image manipulation and editing program, it also includes many different tools designed to perform other tasks. Lightroom, as a Photoshop module Many experts may refer to Lightroom as a "separate" image manipulation application. However, it's actually an image-editing application built into the program. Lightroom is Photoshop's basic image-editing application. It adds many of the same features available in the main program, such as layers, masks, and filters, but it also has features that help photographers and illustrators process images. What It's Like to Use Lightroom Basic Photoshop Features Stacks Photoshop has supported layers for many years. Stacks allow you to save multiple layers, blend them, and create other composite images. Adobe provides three ways to save a stack. Note that you don't have to save multiple images, but you can instead save a single image with different layers. When you open a saved image, Photoshop automatically loads its layers and blends them together. The advantage of having multiple images in a stack is that if one layer changes slightly, you can quickly revert the changes. For instance, if you change the color of a hair in an image and you decide it's wrong, you can change it back to its original color in a second or two. Layers Layers allow you to create transparency and apply color and effects. This is commonly used in photomontages, combined images, and other compositions. You can create a new layer for a different photograph or for an image you've already saved. You can also use the Clone or Healing tools to create a new layer in the area you want it.

In this post, we will show you how to use the selection tools of Photoshop Elements to fix selection edges, blur unwanted parts of an image and add details to a background. Steps 1. Add details and blur the background We will first add details to a background. Then we will blur the new background. Open the image in Photoshop Elements and press ctrl + R or go to: Edit -> Define Blend Mode. Choose "Multiply", the background will be white. Add a white brush to make it transparent. Go to Layer -> Layer Mask -> Reveal Selection Add details to the background Make sure that the background has a mask (white), and apply the Layer Mask so that only the object will be visible. Double-click the selection tool to select the area you want to edit. Add details by increasing the contrast. Select the layer with the white brush with the Layer Mask. Select one of the layers and with the Brush tool, paint with a soft red brush. Add black and white details. Switch to white and add black details with a brush. Add the details by using the white brush with a soft brush. Blur the background Go to Image -> Adjust -> Despeckle. Set the Amount and Radius to 4 and 1 pixel, respectively. Go to Image -> Adjust -> Brightness/Contrast. In the slider, move the top sliders all the way down. Go to Image -> Adjust -> Curves. Set the white and black points to around 45 and 20, respectively. Add a Gaussian Blur with a radius of 6 pixel. Go to Enhance -> Shadows/Highlights. In the slider, move the top sliders all the way down. Go to Image -> Adjust -> Levels. Lower the bottom level around 30 and the middle level around 55. Add an Adjustment Layer. Adjust the levels to get some details back in the image. Step 2. Create a nice selection To create a nice selection, add some components to the edges of the image. These can be at the edges of the figure, or at parts where the image is lighter or darker than the rest of the image. Press ctrl + click on the selection tool to add a rectangle. Then paint with the brush. Click once on a681f4349e

and night in and out and she tailed him to an apartment in the Park View subdivision off of Vista Valley Drive, then returned. The two met again at 3 a.m. on July 17 at a gas station and motel off of Rte. 31, in San Marcos, where they spent several hours together in a pickup truck, according to the affidavit. The affidavit does not specify how she left the scene. Authorities found the girl's body the next day in a spot about 2 miles from the first location. This is a developing story and will be updated.Is there a way to show just the free space on one drive when viewing in Explorer (windows 7), in the little bar that shows the free space? and what would be a set up to do this, as this is really an annoyance (but maybe a work around) Thanks Gordo 08-28-2012, 09:42 PM emadz You could try Disk Clean up, which is found under the All Programs menu. emadz 08-29-2012, 10:56 AM emadz Ok so I have been using explorer a bit more than i thought, and i decided to pay a little more attention to my space, while i have another computer to do this type of stuff on, apparently when i have windows 7 setup to go to drive E:\ it actually shows E:\Free Space (c:\ has the same thing) and it works, if you want a good view the view all space free and then under the view tab look at the space icon, then set the view to show each drive, then you can do what you want (on my computer it shows all the space on E:\) I am sure there is a real way to do this and im trying to get into it, but i can't seem to find it. emadz 09-08-2012, 01:35 PM emadz Thanks for the reply, well i changed my mind about that and went ahead and did it, it has less clutter and alot easier to see what each drive is. On the other computer i was talking about earlier, i used the Disk Clean up, and it was smart enough to delete the giant logs folder (security logs, etc). emadz 09-09-2012, 09:15 AM

Binding site prediction. We have been developing prediction methods for the DNA-binding sites of transcription factors based on the statistical properties of the amino acids composing the DNA-binding domain of the protein. The predictive performance of the various methods developed so far has been evaluated on a collection of about 100 different transcription factors, and the best result obtained was a Pearson correlation coefficient of 0.62. When tested on the complete set of about 400 transcription factors for which binding sites have been experimentally determined, the best result was a correlation coefficient of 0.50. However, the reported correlation coefficient is misleading because of its spurious character: it is an average of several values calculated from different subsets of the dataset. Also, the average results do not necessarily reflect the performance obtained for a single transcription factor. We have therefore developed methods to provide a single estimate of the predictor performance for a single transcription factor. These tools can be used in the prediction of potential transcription factor binding sites. To assess the performance of the predictor, we have applied the methods to the 72 transcription factors that constitute the Myc Network Project. The results are reported in two cases: one in which the binding site of each transcription factor is given as a position weight matrix (PWM) and one in which we have developed a method of binding site prediction that is based on a logistic regression method and thus predicts a PWM for each binding site. The latter is implemented in the TFM search tool. The top returned binding sites for the 72 transcription factors in the TFM search tool are based on the Myc network project data for the available transcription factors, that is, the results of the search can be compared to experimentally validated sites. We have found that the top binding sites for only one transcription factor (TRF2) have been validated experimentally, and that among these only three do not match the top binding sites predicted by the TFM search tool. An analysis of the 5' region of the DNA sequence surrounding the top ranking sites confirms that experimentally validated binding sites are more than 3-5 times more likely to be among the top ranking sites than random sequences. This is a strong indication that the predictive power of the method is not spurious.Q: mysql concat 2 string from different columns I have a table like so company1 id1 company2 id2 amount 1 123 2 444 2
