Torbutton is an application that lets its users choose a new default Tor Browser exit-node to reach the Internet. This is useful when Tor Browser does not work well with your existing exit-node or the source IP of the connection is incompatible with your ISP. The default proxy is the first entry in the list and you can change it. Some ideas about the application: You can either change the default proxy for all users and/or for single users. You can set the proxy manually at launch time, based on specified options or checkboxes. You can set the proxy host to check for proxy configuration, so users with good proxy configurations will not be bothered by the prompt. There is the option to customize the application's GUI. There is the option to set Tor Browser to auto-open, so that when its icon is clicked, a new Tor Browser instance is started. If the application detects any change in Tor Browser, it will restart. You can turn its window to always-on-top status. There is a built-in torrent client that lets you easily download torrents through Tor. There are many similar applications out there, but Torbutton is free and it features some useful options, making it stand out. VirusTotal is a free online service that scans your files for malware. Themida Crack + [32/64bit] [2022]

Themida is a cross-platform software protection utility used to protect applications from reverse engineering or cracking. It is the most modern, intuitive and easy-to-use application that offers all the protection in one compact utility. It allows protection of .exe files, .dll, .bpl, .scr and .ocx files to be developed for Windows, Linux and Mac OS X platforms and is available in both 32-bit and 64-bit versions. Themida's security is based on a new protection technique. When an executable file is loaded into the application, a personal signing signature is generated, as well as a public one, and the private key is saved in an encrypted/protected file. The application uses other files too, like a blacklist file, a key-file, a protection dictionary and a database. After going through the public key, the file is cryptographically verified, and if the key and the signature match, the file is considered protected. By verifying the signature, the application ensures that the developer is its author, and that no other person is modifying it while the file is running. During this process, the executable is also scanned for API hooks, and must not contain such hooks. This ensures the application's integrity, because code that hooks to the operating system and libraries cannot be modified. The program is designed to work well even with older Windows versions, even if it is not possible to use API hooking techniques. It also supports all the new Windows versions available, and it provides an automatic update function to ensure that the protection is kept up to date. By going through all the protected files, the application checks if they are linked to each other, because if a file is linked to a different one, it is impossible to protect the first one. Thanks to the database, which contains all the protected file signatures, it is easy to know if a file is a protected file or not, even if it has been protected for a while or modified. As for the programs and libraries, they also have to be signed by the developer, so they can be trusted as well. If the developer of a file changes something, the corresponding signature of the file is changed, and this feature is applied during the entire application's run-time. The protection can be configured and activated for all the components of the executable or library files, or for specific ones. The application is able to protect any program and library from all the Windows families. Properties: Comp
